Prague, Ceskoslovenska Psychiatrie, Vol 62, No 3, Jun 66, pp 197-201

Abstract: Connection between asthma and enuresis, and changes in the family surroundings of the children are discussed. Suitable methods for investigation of this problem are described. The influence of an incomplete family on the problem is evaluated. Different reactions of boys and girls to the problems caused by the two afflictions are described. 4 Figures, 1 Table, 2 Western, 3 Czech references. (Manuscript received 17 Jun 64.)

"An Operated Arterio-Venous Shunt Treated as Epituberculosis"

Budapest, Orvosi Hetilap, Vol 107, No 26, 26 Jun 1966, pp 1234-1235.

Abstract: The case of a 23-year old female patient shown *in vivo* to suffer from an arterio-venous fistula, treated by operative means, has been described. This is a rare case but should be considered in instances of pulmonar diagnosis. It is necessary to employ layer X-rays and angio-pneumocardiography to effect positive diagnosis. In cases of single shunt, operation is indicated since there is a danger of embolism. The authors observed degenerative lung conditions in the area of deformation. 16 references, including 6 Hungarian, 5 German, 1 Russian, and 4 Western.

BAUTHOR: Tyutyulkov, N.; Fratev, F.ORG: Institute of Organic Chemistry, BANTITLE: Calculating the α -cyclopropenyl- ω -cyclopentadienyl-polyenes using the LCAO-MO theory of molecular orbitals

SOURCE: Bulgarska akademiya na naukite. Doklady, v. 18, no. 12, 1965, 1137-1139

TOPIC TAGS: molecular orbital, charge density, chemical bonding, computer, computer program, molecular structure, organic chemistry/Minsk-2 computer

ABSTRACT:

In an earlier communication (Dokl. BAN, 18, 1965, No 11) an examination was made of the α -cyclopentadienyl- ω -cycloheptatrienyl-polyenes using the theory of molecular orbitals in the conventional variant of Hückel (Z. Phys. 70, 1931, 204). It was demonstrated that the distribution of the π -electronic charge and the alternation in the bond order is such that the structure of the compounds (I) is

The present paper is to investigate the compounds of the group of α -cyclopropenyl- ω -cyclopentadienyl-polyenes (II)

in order to see the degree to which the typical and interesting distribution of the charges of the compounds of order (I) is preserved in this instance as well. The electronic charge of the atom and the bond order were calculated on the Minsk-2 computer using the Hueckel's method program. Results are shown on structural diagrams and in a table. This paper was presented by Corresponding Member BAN B. Kourtev on 7 September 1965. Orig. art. has: 4 figures and 1 table. [Orig. art. in Eng.] [JPRS: 36,464]

PHASE I BOOK EXPLOITATION

RUM/3783

Cluj, Transylvania. Institutul Politehnic

Lucrări științifice (Scientific Works) Cluj, Intreprinderea Poligrafica, 1959.
637 p. Errata slip inserted. No. of copies printed not given. No
contributors mentioned.

PURPOSE: This book is intended for mathematicians, physicists, chemists, and
civil and mechanical engineers.

COVERAGE: The book consists of 59 papers by Rumanian specialists on problems in
science and technology, particularly mathematics, physics, chemistry,
metallurgy, civil and mechanical engineering. Summaries in Russian and
French or German are given at the end of each article. Some of the articles
are accompanied by references. No personalities are mentioned. At the back
of the book there are 23 references, all Rumanian.

ABSTRACT : The large-scale reproduction of Hadena basilinea in Northern Kazakhstan and adjacent regions of RSFSR is treated. Disruptions in the agrotechnics are shown as causes of the mass reproduction. Agrotechnical and chemical means of control are recommended for saving grain crops and controlling the spread of Hadena basilinea.

* TITLE: What Kind of Films Do the Vuzes Need? (Kakiyе fil'my nuzhny vuzam)

PERIODICAL: Vestnik Vysshey Shkoly, 1958, Nr 6, p 66-69 (USSR)

ABSTRACT: So far, not only the distant higher educational institutions, but even the Moskovskiy universitet (Moscow University) manages to do without instructional and scientific motion pictures. The main reason for it is a lack of films. The importance of a training film is illustrated by the example of a motion picture on the "Brownian Movement". When no film is used, the process of movement and development can only be observed by a limited number of people or cannot be seen at all by direct observation. In many cases it will suffice to show only the individual phenomena without connecting them with the subject as a whole. At the beginning of this year, the Chair of Scientific and Instructional Cinematography of the MGU requested the university's mechanical-mathematical and chemical faculties to produce training films for the courses on computing devices and for ultramicrochemical analysis. The author further recommends that films be produced showing prominent USSR scientists delivering lectures. At the Moscow

TITLE: The Spectroscopic Analysis of Impurities in High-purity Sulfur

PERIODICAL: Zavodskaya laboratoriya, 1960, Vol. 26, No. 12,
pp. 1370-1371

TEXT: Two methods of determining the purity of high-purity sulfur by means of spectrum analysis were worked out, namely the direct spectroscopic determination and the determination with previous enrichment of the sample. Work in this field was carried out by A. N. Bronshteyn and L. M. Ivantsov (Ref. 1). In the case of the first method, the standards were prepared in such a manner that the elements Fe, Co, Cu, Ag to be determined were mixed, together with sulfur into a jasper- or agate mortar, and aluminum was introduced as Al_2O_3 . The spectra were recorded by means of the spectrograph ИСП-28 (ISP-28). An exciter, an a.c. arc with an amperage of 7 a was used. The sample was pressed into the channel of the lower carbon electrode, whose diameter was 3 mm and whose depth was 4 mm. The upper electrode, whose diameter was 1 mm and whose depth was 4 mm. The upper electrode, whose diameter was 1 mm and whose depth was 4 mm. Card 1/4

The Spectroscopic Analysis of Impurities
in High-purity Sulfur

S/032/60/026/012/012/036
B020/B056

electrode had the shape of a truncated cone. The electrode spacing was 3 mm. 5% of NaCl was added to all standards and samples. The effect produced by NaCl on the intensity of the spectral lines of the elements determined may be seen from the data given in Table 1. The method is based upon the use of three standards. As inner standard in the determination of Al, Ni, Co, Cu, and Ag, a closed background was used. Iron is determined on the basis of the "absolute" blackenings of the analytical bands. The analytical bands and the range of the determined concentrations are given in Table 2. The mean square error of the single determination of various elements is 9-18%, in the case of nickel and cobalt at concentrations of below 0.001% 30-35%. In the determination of Cu, Ag, In, Ga, Ni, and Co with previous concentration of the sample, a mixture of spectrally pure silicon dioxide (80%) and NaCl (20%) was used as collector. 12 mg weighed portion of the collector is mixed for 20 minutes in a quartz mortar with 600 mg of the analyzed sample, after which the sulfur is burned. For the purpose of removing the organic substances, the residue is heated for 30 minutes to 500° in the muffle furnace. When concentrating the impurities it was found by spectroscopy that they do not go over into

Card 2/4

The Spectroscopic Analysis of Impurities
in High-purity Sulfur

S/032/60/026/012/012/036
B020/B056

the collector quantitatively. The standards were prepared in the same manner as in the preceding case. All impurities, with the exception of Ga, were introduced in form of sulfides, Ga as sulfate. The sulfur used as a basic material contained no Ag, In, Ga, Ni, and Co. Its copper content was determined by means of the successive approximation technique. The analysis was carried out according to a calibration diagram, which had been recorded in the coordinates $[\Delta S; \log C]$. In Table 3, the analytical lines and the ranges of the determination concentration of the elements investigated were enumerated according to the second method. In the second column of the table, also the transmissivity of the various spectral regions is given. The mean square error of a single determination is for Cu 30%, for Ag 11%, indium 12%, Ga 23%, nickel 28%, and Co 24%. The analysis conditions mentioned also permit the determination of lead and tin with an accuracy of $3 \cdot 10^{-5}\%$ and of magnesium with an accuracy of $1 \cdot 10^{-5}\%$. There are 3 tables and 3 Soviet references.

TITLE: Determination of Trace Impurities in Selenium

PERIODICAL: Zavodskaya laboratoriya, 1960, Vol. 26, No. 12,
pp. 1372-1374

TEXT: In a paper by O. G. Koch (Ref. 1) a method for the spectroscopic determination of impurities in selenium with preceding chemical enrichment is described which is, however, too complicated for serial analysis. In the present paper a simple analytical method for pure selenium in a standard equipment is described, which permits determination of impurities with a higher accuracy than in the paper by G. E. Peterson and E. W. Currier (Ref. 2). The conditions of the analysis are given in Table 1. The impurities were determined according to the three-standards-technique. Table 2 shows when the background near the analytical lines was used as inner standard. In all other cases, determination was carried out according to the "absolute" blackenings. The spectra of the samples and standards were photographed three times in each case on the same plate. The mean square

Card 1/2

Determination of Trace Impurities in Selenium S/032/60/026/012/014/036
B020/B056

error of the method for various impurities is 20 to 25%. The error of analysis is reduced by the introduction of carbon powder into samples with an impurity content that is three to five times higher than the lower limit of detection. In the semiquantitative analysis, the lower limit of detection may be largely reduced. The standards were produced from pulverulent selenium, the impurities being introduced in form of selenides or sulfides and tellurium in form of powder. The initial standards contained 10% of the impurities to be determined. Standards with lower concentration were obtained by successive dilution with pulverulent pure selenium by means of a mechanical mixer. There are 2 tables and 3 references: 1 Soviet, 1 Austrian, and 1 US.

TITLE: Determination of sodium and potassium in titanium dioxide by flame photometry

SOURCE: Zavodskaya laboratoriya, v. 31, no. 9, 1965, 1090-1091

TOPIC TAGS: sodium, potassium, titanium dioxide, flame photometry, quantitative analysis, photometric analysis

ABSTRACT: In the method proposed to determine alkali elements in titanium dioxide, the latter is reacted with gaseous hydrogen fluoride at 400C, and the volatile titanium tetrafluoride formed is driven off. Sodium and potassium are left over and are determined in solution with model III Zeiss flame photometer with an interference light filter, the spectrum being excited with an air-acetylene flame. Aqueous solutions of sodium and potassium chloride serve as the standards. Titanium impurities do not interfere with the analysis. The sensitivity of the determination is $2 \times 10^{-4}\%$, and the mean-square-error of a single determination is 10%. Orig. art. has: 1 table.

TITLE:

Quantitative Determination of Aluminum and Titanium in Low-Pressure Polyethylenes by the Method of Spectral Analysis
(Kolichestvennoye opredeleniye alyuminiya i titana v polietilene nizkogo davleniya metodom spektral'nogo analiza)

PERIODICAL:

Zavodskaya Laboratoriya, 1958, Vol 24, Nr 11, pp 1373-1374
(USSR)

ABSTRACT:

D. K. Stepanova took part in this paper. This method was developed for controlling the washing-out of catalysts (titanium tetrachloride, triethyl aluminum) from polyethylenes. As usual in the emission spectral analysis of organic compounds (Refs 3,4) the sample was ashed and mixed with a buffer (copper oxide) and powdered carbon. Standards with the following percent concentrations of aluminum and titanium were prepared: 0.5, 0.3, 0.2, 0.1, 0.06 and 0.03%. The spectra were excited by an alternating-current luminous arc (generator AG-1), and determined on a ISP-22 spectrograph. As analytical lines the Al I 2660.39 Å and Ti I 2646.64 Å were used and the line of Cu I 2627.36 Å was used as the inner standard. The standard

Card 1/2

Quantitative Determination of Aluminum and Titanium in Low-Pressure Polyethylenes by the Method of Spectral Analysis

plot with coordinates ΔS (change in the density of the analytical lines) and $\lg C$ (concentration of the Al and Ti in the corresponding standards) represents a linear function between these two quantities, with a slope of about 45° . The mean deviation was 5.5% in the aluminum determination and 7.3% in the titanium determination.

INTRODUCTION: This collection of articles is intended for scientific workers, students and students of physics and chemistry. It may also be used by engineers and technicians employing molecular spectroscopy.

CONTENTS: The collection of articles describes spectroscopic studies of liquids and solutions, and includes data on applied molecular spectroscopy. Individual articles deal with the molecular interaction in solutions, and specifically with the hydrogen bond problem. Works on the optimum utilization of spectral apparatus and on the analytical application of molecular spectroscopy are also included. Aspects of the structure of high and low molecular compounds and of molecular complexes are also covered. The collection was published in honor of the 70th birthday of Professor Vladislav Matveyevich Chirkovskiy, Soviet specialist in molecular spectroscopy and spectral analysis. There are no references.

TITLE:

Spectral examination of the aging processes of polymers

PERIODICAL:

Akademiya nauk SSSR. Izvestiya. Seriya fizicheskaya,
v. 26, no. 10, 1962, 1316-1317

TEXT: Infrared spectroscopy was examined for its applicability to investigating the aging and stabilization of polymers (e.g., high-density and low-density polyethylene, ethylene - propylene copolymer, fluorine polymers, PVC, polyvinyl alcohol and its acetate, copolymers on the basis of styrene). Conclusions: For the purpose of investigating the oxidation of polymers, infrared spectroscopy is more suitable than chemical analysis as it can be used to determine carbonyl groups in various types of compounds (e.g., in acids, aldehydes, ketones, and ether compounds), to establish the point of saturation of OH and CO groups, to observe the decomposition of the main groups, and to analyze the products of decomposition. Results of work in this field will be published later.

TITLE: Aging of polystyrene materials. Photoaging of styrene - acrylonitrile copolymer, and its stabilization against ultraviolet radiation

PERIODICAL: Plasticheskiye massy, no. 11, 1962, 3-6

TEXT: Films of polystyrene (PS) and of its copolymers CH-10 (SN-10) and CH-28 (SN-28) containing 10 and 28% polyacrylonitrile, respectively, were irradiated with ultraviolet light from a mercury lamp ($\lambda = 2483-5770 \text{ \AA}$; $Q = 0.0152 \text{ cal/cm}^2 \cdot \text{min}$) at 25-30°C. The film thickness was 50-100 μ , the molecular weight 118,000-194,000, the time of irradiation about 400 hrs. The amount of the resulting insoluble fraction and the intrinsic viscosity $[\eta]$ of the soluble fraction were determined.

Results: (1) The amount of insoluble fraction rose with increasing acrylonitrile content, and even more so after reprecipitation.
(2) Molecular weight and $[\eta]$ dropped rapidly within the first 50 hrs, and

Aging of polystyrene materials. ...

approached a constant value after 200 hrs. The content of acrylonitrile did not affect the course of these curves. Samples of high molecular weight were destroyed faster than samples of low molecular weight.

(3) After 400 hrs irradiation, the content of peroxide compounds was 0.06% in PS and 0.08% in SN-28. (4) The spectra of the irradiated PS films showed a formation of carbonyl groups (1700 cm^{-1} band); further, a weak band appeared at $\sim 3400\text{ cm}^{-1}$ (OH groups), and a broad one at $1100\text{-}1300\text{ cm}^{-1}$. In SN-28, a 1720 cm^{-1} band was observed which may due to aldehydes, ketones, or aromatic ethers. (5) Formation of volatile products was not observed after 60 hrs irradiation at $60\text{-}70^{\circ}\text{C}$. Here, the oxygen content in PS increased from 0.2 to 2%. Addition of 0.5 mole% of benzoyl peroxide increased the degree of destruction to the 6-8fold without any change in the spectra. An attempt was then made to stabilize SN-28 by adding substances having an absorption maximum at $300\text{-}400\text{ m}\mu$. Results: (a) 0.5 mole% admixtures of β -naphthyl salicylate, disalicylidene ethylene diamine, its copper salt, 4-propene oxide-2,4-dihydroxy benzophenone, 2,4-dibenzoyl resorcinol, a reaction product of anisole acetone with o-cresol, proved to be weak inhibitors. The effect of 0.5 mole% of 2-hydroxy-4-methoxy benzophenone, as well as that of the
